

1. What is HTML?

HTML, or HyperText Markup Language, is the standard language used to create and structure content on the web. It uses elements and tags to define the structure and meaning of web content. HTML serves as the foundation of most web pages and is often used in combination with CSS (for styling) and JavaScript (for interactivity).

2. What does it do?

It defines the website structure to make a website look better. It defines the content that will be on the Web page.

3. Why is it important in the development of the Track?

To make a website look better altogether and make the whole process a lot easier. It's important because it acts as the foundation for Web pages.

4. What is a good resource student can use?

A good resource that uses this is vs code where i use this to create my websites and shows how html works well in the code.
